                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC domain (TM) of a membrane-spanning protein. The method comprises

CC modifying a nucleic acid encoding a death domain (DD)-lacking membrane

CC spanning protein (e.g. Trail Receptor without Intracellular Domain; TRID)

CC by replacing the nucleic acid encoding the TM of the DD-lacking

CC membrane-spanning protein with a candidate nucleic acid sequence to

CC produce a nucleic acid encoding a modified DD-lacking membrane spanning

CC protein. The modified nucleic acid is then transfected into a host cell,

CC which expresses a DD-containing receptor. The absence of apoptosis of the

CC host cell is determined following exposure of the transfected cell to an

CC apoptosis-inducing ligand. Candidate nucleic acids encoding TM prevent

CC apoptosis of the host cell. The modified nucleic acid encoding the

CC modified death domain-lacking membrane-spanning protein can also include

CC a FLAG-TRID clone, which was used in the method of the present sequence is

CC a FLAG-TRID clone, which was used in the FLAG-epitope tag. The

CC redit suicide DD-lacking membrane-spanning protein and the FLAG-epitope tag. The

CC redit suicide and tissue homeostasis, and to evaluate, interfere and treat

CC events, such as cell proliferation and cell-cell signalling pathways.

CC invention provides methods for the recombinant production of TR5 CC and its use in diagnostic and therapeutic methods. Treatment of a subject in need of enhanced TR5 activity comprises administering an CC agonist to the polypeptide and/or providing TR5 polynucleotide in a CC form so as to effect production of the polypeptide activity in vivo. CC Treatment of a subject with the need to inhibit TR5 polypeptide activity comprises administering an antagonist to the polypeptide activity comprises administering an antagonist to the polypeptide, concleotide sequence encoding the polypeptide for its ligand, substrate or receptor. Diagnosing a disease or a susceptibility comprises determining the presence or absence of mutation in the concleotide sequence encoding the Presence of mutation in the concleotide sequence encoding the presence or absence of mouleotide sequence encoding the TR5 polypeptide in the genome of the subject and/or analysing for the presence or amount of TR5 comprises determining the ample. Identification of compounds CC which bind to TR5 comprises contacting host cells with a candidate compound and assessing the ability of it to bind to the cells. The californic and acute in flammation. arithritis, senticemia, autoimmune diseases (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tumour necrosis related receptor; TR5; human; inflammation; arthritis; septicaemia; transplant rejection; autoimmune disease; inflammatory bowel disease; graft versus host disease; infection; stroke; ischaemia; acute respiratory disease syndrome; psoriasis; restenosis; brain injury; AIDS; bone disease; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide encoding TR5 polypeptide - used to diagnose, prevent and treat e.g. inflammation, arthritis, septicaemia, autoimmune diseases, infections, stroke, ischaemia, ARDS, psoriasis, restenosis, brain injury, AIDS and bone diseases
        graft vs host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis and Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               clone (see AAV56990).

       AAZ21103 to AAZ21102 encode new human secreted proteins and AAZ29861 to AAZ29873 represent the secreted proteins encoded by the polynucleotide sequences. AAZ21103 to AAZ21112 represent probes for the secreted proteins. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, haemostatic and thrombolvtic activity, reconstruction cannot be activity.

The polynucleotides and proteins can also be used as nutritional sources or supplements. Such uses include use as a protein or amino acid supplement, use as a carbon source, use as a nitrogen source and use as a source of carbohydrate. They may also have utility in compositions used for bone, cartilage, tendon, ligament, and/or nerve tissue growth or regeneration, as well as for wound healing and tissue repair and replacement, and in the treatment of burns, incisions and ulcers. The proteins which induce cartilage and/or bone growth in circumstances where bone is not normally formed, have application in the healing of bone fractures and cartilage damage or defects in humans and other animals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       claimed methods of identifying agonists and antagonists, i.e.
compounds that bind to the receptors or ligand, and which activate
(agonist) or inhibit activation of (antagonists) TR1, TR3, TR5 or
TL3. A screening kit for identifying agonists, antagonists,
ligands, receptors, substrates, enzymes etc. for TR1, TR3, TR5 or
TL3 polypeptides is provided. The agonists and antagonists are
useful for treatment of chronic and acute inflammation, arthritis,
septicaemia, autoimmune disease e.g. inflammatory bowel disease,
psoriasis, transplant rejection, graft versus host disease,
infection, stroke, ischaemia, acute respiratory disease syndrome,
restenosis, brain injury, AIDS, bone diseases, cancer (e.g.
lymphoproliferative disorders), atherosclerosis and Alzheimer's
disease, etc., caused by imbalance of TR1, TR3, TR5 or TL3.

This sequence is the human TRAIL receptor TRAIL-R3 of the invention. An antibody against the TRAIL receptors is useful for detecting mammalian DR5 or TRAIL-R3 proteins in a sample. Recombinant cells are useful in bioassays for screening for (ant)agonists of DR5 or TRAIL-R3 proteins. (Ant)agonists identified by the assay are useful for modulating the apoptotic activity mediated by DR5 or TRAIL-R3 proteins. Proteins activity mediated by DR5 or TRAIL-R3 proteins Apoptosis related conditions which are treated in this way, include cancer (e.g. lymphomas and carcinomas), autoimmune diseases (e.g. systemic lupus are treated in the proteins and immune-modiated define the proteins and immune-modiated states.
                                                 sclerosis, retinitis pigmentosa, cerebellar degeneration, myelodysplastic syndromes (e.g. aplastic anaemia) and ischaemic injury (e.g. myocardial infarction and stroke). The polynucleotides can alone be used to treat these diseases. Antisense oligonucleotides to the DNA sequences can be used to form a composition that is useful for inhibiting expression of a human DR5 or TRAIL-R3 protein.
                                                                                                                                                                                                                     erythematosus and immune-mediated glomerulonephritis), viral infections (e.g. herpes virus, poxvirus and adenovirus), degenerative disorders (e.g. Alzheimer's disease and Parkinson's disease), amyotrophic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 16; Page 62-63;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Newly isolated polynucleotide encoding a mammalian TRAIL receptor protein - useful in for screening for (ant)agonists that modulate the apoptotic activity mediated by DR5 or TRAIL-R3 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alnemri ES;

TRAIL-BP can be used for inhibiting the biological activities of TRAIL or for purifying TRAIL. TRAIL-BP proteins can be used for treating a TRAIL-mediated disorder such as T cell death in HIV-infected patients. They can be used for treating thrombotic microangiopathies such as thrombotic thrombocytopenic purpura, haemolytic-uraemic syndrome, clotting of small blood vessels or systemic lupus erythematosus. The TRAIL-BP nucleic acids can also be used for gene therapy. They can also be used as
                                                                                                                                                                                 therapy.

                  A pure or recombinant polypeptide which binds to a polyclonal antibody specific for the mature UL144 is useful for screening molecules which block induction of apoptosis or interfere with antiapoptotic activity. The polypeptide is also useful for modulating apoptosis and useful in treatment of conditions associated with abnormal physiology or development, such as cancer or degenerative conditions and for regulation of viral infection and replication. At least five different death receptors are known, which include the CD95 [Fas/APO-1], the TNF receptor-1, TNF receptor apoptosis-mediated approach to the condition of the condition of the condition of viral infection and replication. At least five different death receptors are known, which include the CD95 [Fas/APO-1], the TNF receptor-1, TNF receptor apoptosis-mediated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       γQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              x3555555555555555555555555555x x
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC domain (TM) of a membrane-spanning protein. The method comprises
CC modifying a nucleic acid encoding a death domain (DD)-lacking membrane
CC spanning protein (e.g. Trail Receptor without Intracellular Domain; TRID)
CC by replacing the nucleic acid encoding the TM of the DD-lacking
CC membrane-spanning protein with a candidate nucleic acid sequence to
CC produce a nucleic acid encoding a medified DD-lacking membrane spanning
CC which expresses a DD-containing receptor. The absence of apoptosis of the
CC host cell is determined following exposure of the transfected cell to an
CC apoptosis-inducing ligand. Candidate nucleic acids encoding TM prevent
CC apoptosis of the host cell. The modified nucleic acid encoding the
CC modified death domain-lacking membrane-spanning protein can also include
CC a nucleic acid sequence encoding an epitope tag. The present sequence is
CC affac-epitope is a useful marker to purify proteins encoded by the
CC modified DD-lacking membrane-spanning protein. The present invention.
CC TAG-epitope is a useful marker to purify proteins encoded by the
CC modified DD-lacking membrane-spanning proteins and the first end treat
CC membrane-spanning proteins may be used in defining processes involved in
CC cell suicide and tissue homeostasis, and to evaluate, interfere and treat
CC events, such as cell proliferation and cell-cell signalling pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                 CC receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TWF related ligands 1 and 3 (TNRL1 and TNRL3) or CC fragments, and isolated TWF related ligands 1 and 3 (TNRL1 and TNRL3) or CC their active fragments. APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 in an individual. Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic CC molety. APO4 polypeptides are also useful for identifying selective comolety. APO4 polypeptides are also useful for identifying selective cancer can also useful to the polypeptides are the polypeptides are also useful for comparison or CC expressed on the cell surface. The binding is preferably performed in CC vivo. APO4 polypeptides/active fragments are also useful for screening CC for agonists and antagonists by binding and observing the changer in APO4 cativity. Effective pharmacological agents useful in diagnosis or CC treatment of disease are also identified using APO4 polypeptides/active fragments are also seful in diagnosis or CC with a cytoplasmic domain of APO4 and detecting a change in level of APO4 cativity. The method is performed in vivo or in vitro. APO polypeptides are all useful as immunogens for preparing antibodies. APO4 is also CC useful for diagnosis/treatment of developmental or gestational cc abnormalities. APO8 was transfected to human breast carcinoma cell line of CC and an although a change a change of the compared to the

                                                                                                                                                                                                            for preventing or reducing the advancement, severity or effects of an immunological disease involves administering a TRAIL-R2 or TRAIL-R3 blocking agent such as a soluble TRAIL-R (preferably comprising a human immunoglobulin Fc domain) and an antibody. A method of treating cancer involves administration of antibodies against TRAIL-R3 or TRAIL-R2. A method of inducing cell death involves administration of an agent capable of inhibiting the
                                                                                                                                                                                                                                                                                                    a putative glycosylphosphatidylinositol-anchored protein, which is either cell-associated or processed and secreted. Secreted TRAIL-R3 competes for the binding of TRAIL to TRAIL-R1 and/or TRAIL-R2, thereby acting as an inhibitor of apoptosis. Expression of TRAIL-R3 is restricted to peripheral blood lymphocytes and skeletal muscle. It is likely that TRAIL-3 acts as an important regulator of TRAIL-R2 and -R3 induced cell death in vivo. A method
                                                                                                                                                                                                                                                                                                                                                                                             cysteine-rich receptor of the tumour necrosis factor receptor. The invention is related to novel receptors for TRAIL, i.e. 7 (see AAY05725) and TRAIL-3. TRAIL-3 is highly glycosylated.
                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents TRAIL-R3, a novel mammalian constant receptor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           06-MAY-1998;

                                                                                                                            This peptide is encoded by DNA21705, a cDNA clone obtained by PCR amplification (see AAV84349-50) of human breast carcinoma cDNA. The peptide shows homology to a peptide (see AAW88449) derived from human tumour necrosis factor receptor 1 (TNFR1). DNA21705 was used as a probe to screen a human foetal lung library, yielding a clone (see AAV84347) encoding Apo-2DcR, a novel member of the TNFR family that binds to Apo-2 ligand and is involved in apoptosis. Apo-2DcR polypeptides can be used in methods for the modulation and diagnosis of apoptosis e.g. in cases of neurodegeneration, autoimmune diseases and inflammation.

RTD,

inhibitor of

Apo-2 ligand-induced apoptosis

```
The present sequence is human RTD, a novel protein capable of binding Apo-2 ligand. RTD is a receptor for tumour necrosis factor, belonging to the family of trail receptors. It is an initial content of the family of trail receptors. It is an economic factor, belonging to the family of trail receptors. It is an economic factor, belonging to the family of trail receptors. It is an economic factor for the sequence and the factor factor factor factor for the vectors deposited as ATCC 209201 cencoded by the cDNA insert of the vectors deposited as ATCC 209201 or ATCC 209202 (see also AAX25093). These cDNAs differ in sequence at a single nucleotide, resulting in serine or leucine at amino acid position 310 of RTD. Isolated RTD polypeptides, especially the extracellular domain (ECD), chimeric molecules including RTD or its ECD, and nucleic acids encoding such polypeptides are claimed, as are antibodies, vectors, host cells (especially CHO, yeast and

                                   The present sequence represents human Tango-74. Tango polypeptides are useful for identifying compounds which bind the polypeptide via direct binding, competition binding assays or Tango-71, -73, -74, 76 or -83 mediated signal transduction. Tango polypeptides are also useful for identifying modulating compounds by determining effect on Tango activity Tango polypeptides and nucleic acids are useful for diagnosing diseases related to aberrant expression of Tango, and Tango polypeptides are useful for raising antibodies which can be used in diagnostic assays for detection of Tango, and also for generating anti-idiotype antibodies for
                                                                                                                                                                                                      New TANGO polypeptides diagnostic agents and f expression of TANGO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      E coll cells), transgenic and knockout animals, and a method of modulating apoptosis in mammalian cells by exposing the cells to RTD polypeptide. This therapy can be accomplished e.g. using in vivo or ex vivo gene therapy techniques. RTD chimeric molecules comprising immunoglobulin sequences can be used to inhibit Apo-2 ligand activities, e.g. apoptosis or NT-Kappa B induction or the activity of another ligand to which RTD binds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 biological activity of TRAIL. TRAILR proteins can be used for treating thrombotic microangiopathies, e.g. thrombotic thrombocytopenic purpura (TTP) or haemolytic-uraemic syndrome (HUS), clotting of small blood vessels in e.g. AIDS, multiple sclerosis or systemic lupus erythematosus or for reducing TRAIL-mediated death of T cells in HIV-infected patients They can also be used to purify TRAIL or TRAIL-expressing cells or as carriers for delivering agents to cells bearing TRAIL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; TRAIL; TRAIL receptor; immunoreactive; thrombotic microangiopathy; HIV infection; tumour necrosis factor related apoptosis inducing ligand; TNF related apoptosis inducing ligand; systemic lupus erythematosus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  apoptosis-inducing ligand (TRAIL) receptor designated TRAILR4B. TRAILR proteins can be used for binding TRAIL, e.g. to measure or inhibit the biological activity of TRAIL. TRAILR proteins can be used for treating thrombotic microangiopathies, e.g. thrombotic thrombocytopenic purpura (TTP) or haemolytic-uraemic syndrome (HUS), clotting of small blood vessels in e.g. ALDS, multiple sclerosis or systemic lupus erythematosus or for reducing TRAIL-mediated death of T cells in HIV-infected patients. They can also be used to purify TRAIL or TRAIL-expressing cells or as carriers for delivering agents to cells bearing TRAIL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated TRAIL receptor polypeptides - us
for treating e.g. thrombotic microangiopathy,
systemic lupus erythematosus or HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TNF related apoptosis

CC receptor, TRIO. TRIO polyperbides or agonists can be used for treating CC diseases and disorders associated with inhibition of apoptosis, e.g. CC cancers (e.g. follicular lymphomas, carcinomas with p53 mutations, and CC hormone-dependent tumours, such as breast cancer, prostate cancer, CC (Exposi's sarcoma and ovarian cancer), autoimmune disorders (e.g. systemic CC lupus erythematosus and immune-related glomerulonephritis rheumatoid CC arthritis), viral infections (e.g. herpes viruses, pox viruses and CC adenoviruses), inflammation, graft versus host disease, acute graft CC rejection and chronic graft rejection. Antagonists can be used for treating disease, amyotrophic lateral sclerosis, e.g. AIDS, neurodegenerative disorders (e.g. Alzhelmer disease, CC e.g. AIDS, neurodegenerative disorders (e.g. Alzhelmer disease, CC earmila), ischemic injury (e.g. as caused by myocardial infarction, stroke and reperfusion injury), toxin-induced liver disease (e.g. as caused by calcohol), septic shock, cachexia and anorexia. Antagonists can also be used for treating inflammatory diseases and disorders, e.g. inflammatory cancers and disorders, e.g. inflammatory cancers and disorders, e.g. inflammatory cancers and so be used for treating inflammatory diseases and disorders, e.g. inflammatory cancers and also be used for treating inflammatory cancers and content this, psoriasis and cancers

                                                                                                                                      development, such as cancer or degenerative conditions and for regulation of viral infection and replication. At least five different death receptors are known, which include the CD95 (Fas/APO-1), the TNF receptor-1, TNF receptor apoptosis-mediated protein (TRAMP), death receptor-6 (DR-6), and TNF-related apoptosis-inducing ligand (TRAIL) receptors 1, 2 and 4.
                                                                                                                                                                                                                                       A pure or recombinant polypeptide which binds to a polyclonal antibody specific for the mature UL144 is useful for screening molecules which block induction of apoptosis or interfere with antiapoptotic activity. The polypeptide is also useful for modulating apoptosis and useful in treatment of conditions associated with abnormal physiology or device the polypeptide is also useful to modulating apoptosis.
                                                                                                                                                                                                                                                                                                                              Disclosure; Page 73-74; 76pp; English.

Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor alpha (Thr-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartilage, the proliferation of inner ear utricular supporting cells or monocytes, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   24-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a human secreted and transmembrane polypeptide. The specification describes human polypeptides, designated PRO196, PRO444, PRO183, PRO185, PRO215, PRO215, PRO217, PRO228, PRO286, PRO365, PRO1361, PRO1183, PRO1183, PRO1272, PRO1419, PRO4999, PRO7170, PRO365, PRO1361, PRO1308, PRO1183, PRO1272, PRO1419, PRO4999, PRO7170, PRO337, PRO1361, PRO4356, PRO266, PRO265, PRO941, PRO1996, PRO6003, PRO6004, PRO350, PRO2630 and PRO6309. The biological activity of cells can be modulated with agents that bind to these polypeptides, resulting in the death of the cells. The polynucleotides encoding these polypeptides are useful in the recombinant production of the polypeptides are useful in the recombinant production of the homologous sequences, or to map the gene. They may also be used for analysing genetic disorders, and to produce transgenic animals which are useful for the development and screening of therapeutically useful
                                                                                                                                                                                                                 Human; TR10 receptor; cytostatic; immunosuppressive; neuroprotective; antiinflammatory; anti-HIV; antiparkinsonian; nootropic; cardiant; vasotropic; antiallergic; antidiabetic; vulnerary; ophthalmological; antiviral; antipacterial; antifungal; antiparasitic; gene therapy; tumour necrosis factor receptor; cancer; leukaemia; autoimmune disorder; appoptosis; cardiovascular disorder; inflammatory disease; wound;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid molecule encoding a PRO polypeptide which is a transmembrane polypeptide is useful for gene therapy and identification of related polypeptides -
                                                                                                                                                                                                                                                                                                                         Human
                                                                                                                                                                                                                                                                                                                                                     19-MAR-2001

        The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of a polynucleotide comprises at least 15 nucleotides; or (b) a combination of the specification of the sequences.
 oligonucleotide of an oligonucle
                                                                                                Claim
                                                                                                                                Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the evelopment of ABC18737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH93633 to AAH18742 represent human cDNAs sequences; AAH92446 to CC AAB95893 represent human amino acid sequences; AAH93629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity chamchas: Immune system suppression, activity, chamchactic/Chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                           Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       C.N.S disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, heemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                       22-AUG-1997;

These may also be used to inhibit production of TNF-alpha and eicosanoids, as research reagents and materials for discovering treatments and diagnostics to animal and human diseases. The polypeptides may further be used as immunogens to produce antibodies immunospecific for the TR6 polypeptides. The polynucleotides may also be used as hybridization probes for CDNA and genomic DNA, for isolating full-length cDNAs and genomic clones encoding TR6 and of other genes having high sequence similarity to TR6 gene, and for chromosome identification. The present sequence represents a partial amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; DR5; DR5s; TRAIL-R3; apoptosis related condition; cancer; thera autoimmune disease; viral infection; degenerative disorder; amyotrophic lateral sclerosis; retinitis pigmentosa; isohaemic injury; cerebellar degeneration; myelodysplastic syndrome; splice variant.
                                                                                                                                                                Newly isolated polynucleotide encoding a mammalian TRAIL receptor protein - useful in for screening for (ant)agonists that modulate the apoptotic activity mediated by DR5 or TRAIL-R3 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-JUN-1999

This sequence is the human TRAIL receptor DR5s of the invention. An antibody against the TRAIL receptors is useful for detecting mammalian DR5 or TRAIL-R3 proteins in a sample. Recombinant cells are useful in bioassays for screening for (ant)agonists of DR5 or TRAIL-R3 proteins. (Ant)agonists identified by the assay are useful for modulating the apoptotic activity mediated by DR5 or TRAIL-R3 proteins. Apoptosis related conditions which are treated in this way, include cancer (e.g. lymphomas and carcinomas), autoimmune diseases (e.g. systemic lupus erythematosus and immune-mediated glomerulonephritis), viral infections

This is the amino acid sequence of Tango-63e, a new member of the human tumour necrosis factor receptor superfamily. It was deduced from a human prostate cDNA clone sequence (see AAV62673). Two different forms of Tango-63, i.e. Tango-63e and Tango-63d (see AAW79260), have been identified. These are identical with the exception of the deletion of amino acids 183-211 of Tango-63d in Tango-63e. The invention also encompasses nucleic acid molecules encoding Tango-63d and -63e, vectors containing these nucleic acid molecules cells harboring recombined DNA encoding Tango-63d and/or -63e, transgenic animals that express Tango-63d and/or -63e, and recombinant knockout animals that fail to express Tango-63d and/or -63e. Methods are provided for the diagnosis and treatment of disorders associated with either an abnormally high or an abnormally low rate of apoptotic cell death. Inhibitors can be used for treating e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (e.g. Alzheimer's disease and Parkinson's disease), amyotrophic lateral sclerosis, retinitis pigmentosa, cerebellar degeneration, myelodysplastic syndromes (e.g. aplastic anaemia) and ischaemic injury (e.g. myocardial infarction and stroke). The polynucleotides can also be used to treat these diseases. Antisense oligonucleotides to the DNA sequences can be used to form a composition that is useful for inhibiting expression of a human DR5 or TRAII-R3 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated tumour necrosis factor related proteins - used to develop products for the diagnosis and treatment of apoptosis-related disorders, e.g. cancers, autoimmune disorders or neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tumour necrosis factor receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  including AIDS, autoimmune diseases such as rheumatoid arthritis, and type I diabetes, septic shock, cerebral malaria, graft rejection, cytotoxicity, cachexia, and inflammation can be treated by altering the expression or activity of the polypeptides. The products can also be used for detection, diagnosis and screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    herpesviruses, poxviruses, and adenoviruses). Agonists can be used for treating e.g. neurodegenerative diseases, e.g. Alzheimer's disease, amyotrophic lateral sclerosis (ALS), Huntington's disease, retinitis plymentosa, spinal muscular atrophy, various forms of cerebellar degeneration, anaemia, myelodysplastic various forms of cerebellar degeneration, anaemia, myelodysplastic
receptor, TR6. TR6 polypeptides and polynucleotides can be used in treatment of chronic and acute inflammation, arthritis, septicaem: autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           syndrome, ischemic injury, myocardial infarction, cerebral ischemia or toxin-induced injury. In addition, T cell mediated diseases,
                                                           This sequence receptor, TR6.

CC This is the amino acid sequence of human death domain containing CC receptor 5 (DR5), deduced from an isolated DR5 nucleic acid (see CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 is a novel member of the tumour necrosis factor (CC AAV61469). DR5 polypeptides is It shows homology to human (CC TNFR1), FAS and DR3. DR5 CDNA has been identified in primary (CC dendrinitie cells, endothelial tissue, spleen, chronic lymphocytic dead in the recombinant production of DR5 polypeptides. (CC e.g. the extracellular transmembrane, intracellular domains, cells and the combinant methods of producing (CC e.g. the extracellular transmembrane (CC domain; vectors, host cells and recombinant methods of producing the polypeptides are claimed. DR5 polypeptides can be used to identify agonists and antagonists, and to raise antibodies. (CC the polypeptides are claimed. DR5 polypeptides can be used to treat diseases DR5 mediated signalling, can be used to treat diseases by inflammation, graft versus host disease, acute graft (CC rejection, chronic graft rejection, rheumatoid arthritis) and (CC disease). Antagonists, which decrease DR5 mediated signalling, can be used to treat diseases, anyotrophic lateral sclerosis, retinitis, (CC parkinson's diseases, amyotrophic lateral sclerosis, retinitis, (CC parkinson's disease, amyotrophic lateral sclerosis, retinitis, (CC pickexia and anorexia. The products can also be used for detection, (CC cancersia and drug screening.) isohemic injury, toxin-induced (CC cancersia and anorexia. The products can also be used for detection, (CC cancersia and anorexia. The pro

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes isolated Tumor Necrosis Factor (TNF) family Creceptor polypeptides: APO4, APO6, APO8 and APO9 or their active criagments, and isolated TNF related ligands 1 and 3 (TNRL1 and TNRL3) or their active fragments. APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 in an individual. Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic molety. APO4 polypeptides are also useful for identifying selective binding agents linked to a therapeutic complete. APO4 polypeptide/active fragment which is extracellular, or capents to the polypeptide/active fragment which is extracellular, or capents to the polypeptides. The binding is preferably performed in convivo. APO4 polypeptides/active fragments are also useful for screening conjusts and antagonists by binding and observing the changer in APO4 activity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/active fragments and APO4 signal transducer molecules that specifically interact with a cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vivo or in vitro. APO0 polypeptides are all useful as immunogens for preparing antibodies. APO4 is also useful for diagnosis/treatment of developmental or gestational call line corrections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Ma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 42
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (e.g. lymphomas and carcinomas), autoimmune diseases (e.g. systemic lupus erythematosus and immune-mediated glomerulonephritis), viral infections (e.g. herpes virus, poxvirus and adenovirus), degenerative disorders (e.g. Alzheimer's disease and Parkinson's disease), amyotrophic lateral sclerosis, retinitis plymentosa, cerebellar degeneration, myelodysplastic syndromes (e.g. aplastic anaemia) and ischaemic hjury (e.g. myocardial infarction and stroke). The polynucleotides can also be used to treat these diseases. Antisense oligonucleotides to the DNA sequences can be used to form a composition that is useful for inhibiting expression of a human DR5 or TRAIL-R3 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is the human TRAIL receptor DR5 of the invention. An antibody against the TRAIL receptors is useful for detecting mammalian DR5 or TRAIL-R3 proteins in a sample. Recombinant cells are useful in bioassays for screening for (ant)agonists of DR5 or TRAIL-R3 proteins. (Ant)agonists identified by the assay are useful for modulating the apoptotic activity mediated by DR5 or TRAIL-R3 proteins. Apoptosis related conditions which are treated in this way, include cancer

The invention relates to Apo-2DoR (see AAW88408), a novel member of the tumour necrosis factor receptor family that binds to Apo-2 ligand and is involved in apoptosis. Apo-2DcR polypeptides are used to modulate apoptosis of mammalian cells (claimed) e.g. in the treatment of neurodegeneration, autoimmune diseases and inflammation. The Apo-2DcR polypeptides are optionally used in conjunction with Apo-2 ligand, the bloavablability of which is increased by antibody-mediated blockade

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents human Apo-2 can be used CC therapeutically to induce apoptosis in mammalian cells, and so is useful CC therapeutically to induce apoptosis in mammalian cells, and so is useful CC to treat conditions associated with decreased apoptosis e.g. cancer. CC Apo-2 is believed to be a new tumour necrosis factor (TNF) receptor CC (TNFR). TNF cytokines can induce apoptosis, thought to be initiated by. CC binding to TNFRe, and Apo-2 triggered caspase-dependent apoptosis. It CC mammalian cancer cells, and to produce Apo-2, useful to treat CC mammalian cancer cells, and to produce Apo-2 chimeras useful therapeutically (e.g. those containing immunoglobulin sequences can be CC inhibit apoptosis) or diagnostically (e.g. those comprising an epitope CC tag polypeptide allow Apo-2 detection and purification using anti-tag CC antibodies). It can be used to produce antibodies which can be combined CC with a (particularly pharmaceutically acceptable) carrier in compositions CC comprising first and second Apo-2 antibodies). Agonistic (especially confidence apoptosis in mammalian cancer cells, and antagonistic antibodies used to block noncorrects (e.g. in nanrodecenerative afterses) Apo-2 and Apo-2 antibodies used to block noncorrects (e.g. in nanrodecenerative afterses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

CC autoimmune disorder. The method comprises administering an antibody CC specific for human death domain containing receptor-5 (DR5); AAB29790) CC and a second agent selected from TRAIL (TNF-related apoptosis-inducing CC ligand), a tumour necrosis factor (TNF), a TNF blocking agent, an C immunosuppressive agent, an antibiotic, an antiinflammatory agent, a chemotherapeutic agent, or a cytokine. DR5 is a member of the TNF CC inmunosuppressive agent, and is a mediator of apoptosis, being able to CC bind TRAIL. The method of the invention is useful for the treatment of CC graft-versus-host disease, viral infection, cancer, leukemia, and condeficiency, or an autoimmune disorder. The DR5 antibody is useful for treating or preventing diseases and conditions associated with CC increased cell survival and/or insensitivity to apoptosis inducing agents. Examples of such diseases are solid tissue concers and CC leukaemias. Antagonists of DR5 are useful for inhibiting T-cell mediated immune responses such as graft-versus-CC associated with T-cell mediated immune responses such as graft-versus-CC host responses, and preventing and/or treating diseases and conditions associated with T-cell mediated immune responses such as graft-versus-CC bowel disease, autoimmune diseases and leukaemia. DR5 nucleotides and proteins are useful for disponsis, prevention and/or treatment of CC parasitic, bacterial, and viral infections, restenosis and autoimmune CC disorders. The present sequence represents human DR5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The invention provides a method for producing antibodies (Abs) by CC immunizing an animal with at least two different antigens. The method CC comprises: (a) immunizing an animal with at least two different antigens, CC comprises: (a) immunizing an animal with at least two different antigens, CC comprises: (a) immunizing an animal with at least two different antigens, CC comprises: (a) immuniciant and compressed to generate polyclonal Abs against each antigen in the animal; (b) CC preparing monoclonal Abs (MAbs) using immune cells of the above animal; CC and(c) screening the MAbs to identify one or more MAbs which bind to each cused for therapy. The Apo-2L receptor (ant)agonists and can be cused for therapy. The Apo-2L receptor Abs can be used for enhancing commune-mediated cell death in cells expressing Apo-2L receptors. CC Agonistic Abs which specifically cross-react with 2 or more different CC Apo-2L receptors can be used for inducing apoptosis in mammalian cancer cells. Antagonistic Abs can be used for blocking apoptosis, e.g. in neurodegenerative disease, or to block potential autoimmune/inflammatory celfects of Apo-2 resulting from NF-approx. Ha activation. The Abs can also be used for detection, diagnosis and affinity purification. The method con reduce the number of animals that need to be immunized and sacrificed in order to make 2 or more MAbs with differing antigen-binding constitutions. The method conference of the constant of the c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC The sequence represents human Apo-2, an apoptotic protein used as an CC immunogen to make the monoclonal antibodies of the invention. The CC invention relates to an isolated antibody which specifically cross-reacts CC with two or more different Apo-2 ligand (Apo-2L) receptors. Apoptosis by CC monoclonal antibody 3H3.14.5 after crosslinking with anti-mouse Ig was CC tested. Human 9D cells in complete RPMI medium were added. Cells were CC incubated with the monoclonal antibody in 100 micro on ice for 15 CC minutes. Cells were then incubated with goat anti-mouse IgG FC complete RPMI medium overnight at 37 degrees C. After washing once with PBS, cells were resuspended in PBS containing 0.5% BSA and incubated with FITC-CC Annexin and propidium iodide for 15 minutes in the dark. Dead cells were detected by FACScan. The 3H3.14.5 antibody was able to inhibit apoptosis induced by interaction between Apo-2L and Apo-2. This antibody was further capable of inducing apoptosis of 9D cells in the presence of an CC inducing apoptosis in mammalian cancer cells for treating cancer CC including carcinoma, lymphoma, blastoma, sarcoma and leukaemia, and are useful in diagnostic assays for their antigen, e.g. detecting its CC expression in specific cells, tissues or serum and for affinity courification of antigen from recombinant cell culture or natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

CC cells which express the Apo-2 receptor protein (AAB73442, AAB73443).

CC cells which express the Apo-2 receptor protein (AAB73442, AAB73443).

CC The method involves exposing the cells to an Apo-2 agonistic antibody,

CC which induces Apo-2 receptor-mediated apoptosis. The Apo-2 receptor

CC (also referred to simply as Apo-2) is a member of the tumour

CC necrosis factor receptor (TNFR) family, and its natural ligand is the

CC Apo-2 ligand (Apo-2L, also known as TRAIL). The Apo-2 receptor is able

CC to trigger caspase-dependent apoptosis, and is also able to activate

CC NF-kappa-B (nuclear factor kappa B). The Apo-2 receptor is an

CC approximately 45 kD type I transmembrane protein, and contains a death

CC domain in the cytoplasmic region (residues 324-392). It exhibits

CC significantly more sequence identity to the apoptosis-linked receptor

CC The Apo-2 receptor agonist monoclonal antibodies used in the method of

CC the invention are 3F11.39-7, 3H3.14, 5, 3D5.1.10 and 3H1.18.10. The

CC method of the invention is used to induce apoptosis in Apo-2-expressing

CC cells, particularly cancer cells. It may therefore be used for treating

CC mammalian cancers, especially lung cancer, colon cancer and glioma.

CC in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inducing exposing Apo-2 ago
